

GEOnet Names Server (GNS) How To

Compose a Query and Export Data

To access the GNS query and export functions, visit GNS at <http://geonames.nga.mil/gns/html/> and select the **GNS Search - Text Based Page** option (<http://geonames.nga.mil/namesgaz/>). The query page defaults to search, indicated by an active search button having a yellowish background tint and bold text.

Active search button.

Compose a Query - display results to the screen:

There are many ways to compose a GNS query, from the simple to the complex. The simplest query is for a name¹ against the entire content of the database. Search qualifiers include **Starts With**, **Exact Match**, **Contains**, and **Ends With**. Multiple name input is possible by selecting the **Multiple Name Search** radio button below the country name list box. Up to 500 lines of individual names (one name per line) can be included for search types Starts With, Exact Match, and Ends With, and up to 100 lines of individual names (one name per line) can be included for search type Contains. The query is executed by clicking on any of the **Search Database** buttons scattered over the page.

Select Multiple Name Search and the Name input widget expands to show the ability to accommodate more than one name.

¹ The use of the term **name** is synonymous with the term **feature name**.

The database stores feature names in both **Reading Order**² (**Mount Everest**) and **Reversed Generic**³ (**Everest, Mount**) fields encoded in Unicode UTF-8. The database also converts and stores these feature names in fields called **SORT_NAME_RO** for reading order and **SORT_NAME_RG** for reversed generic.

A sort name is a form of the full name that allows for alphabetical sorting of the data into gazetteer sequence. For Roman script names, all character/diacritic combinations and special characters are substituted with QWERTY (visible U.S. English keyboard) characters, all characters are upper-cased, numerals are converted to lower-case characters (0-9 = a-j), spaces and hyphens are stripped out, and finally commas replaced with a space. Additionally, for non-roman script names in languages using Arabic based letters, vowel markings/pointers are removed.

The search function converts user input to sort name and looks at matching the search string against both sort name fields.

Wild card searches are possible by using percent (%), which stands for zero (0) or more characters, or underline (_), which stands for a single character. All search qualifiers by default employ a percent (%) wild card with the exception of Exact Match:

Starts With: Search String%

Exact Match: Search String

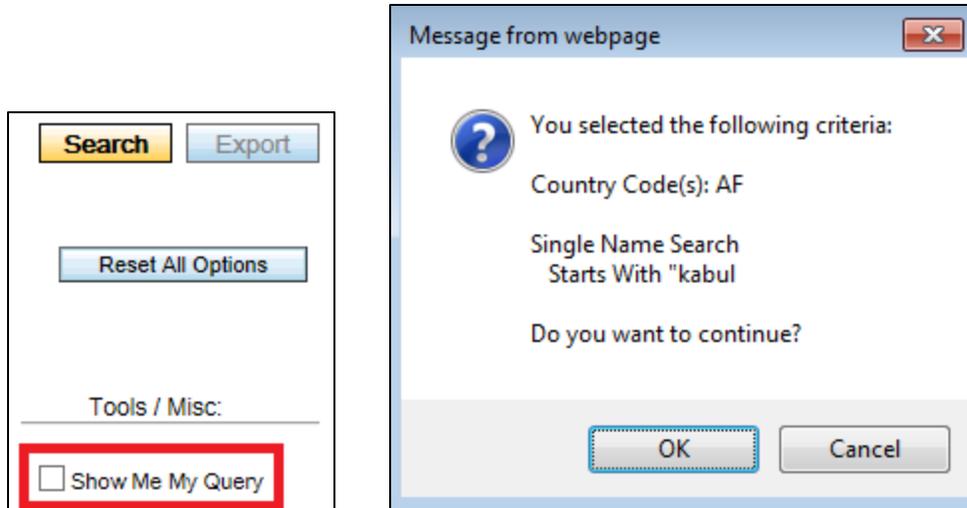

Contains: %Search String%

Ends With: %Search String

An option is provided to view the composed query prior to executing it by selecting **Show Me My Query**, located below the **Search** and **Export** buttons under **Tools/Misc**. Once selected, and besides showing the query parameters, it provides an option to cancel out of the query so its parameters can be further fine-tuned.

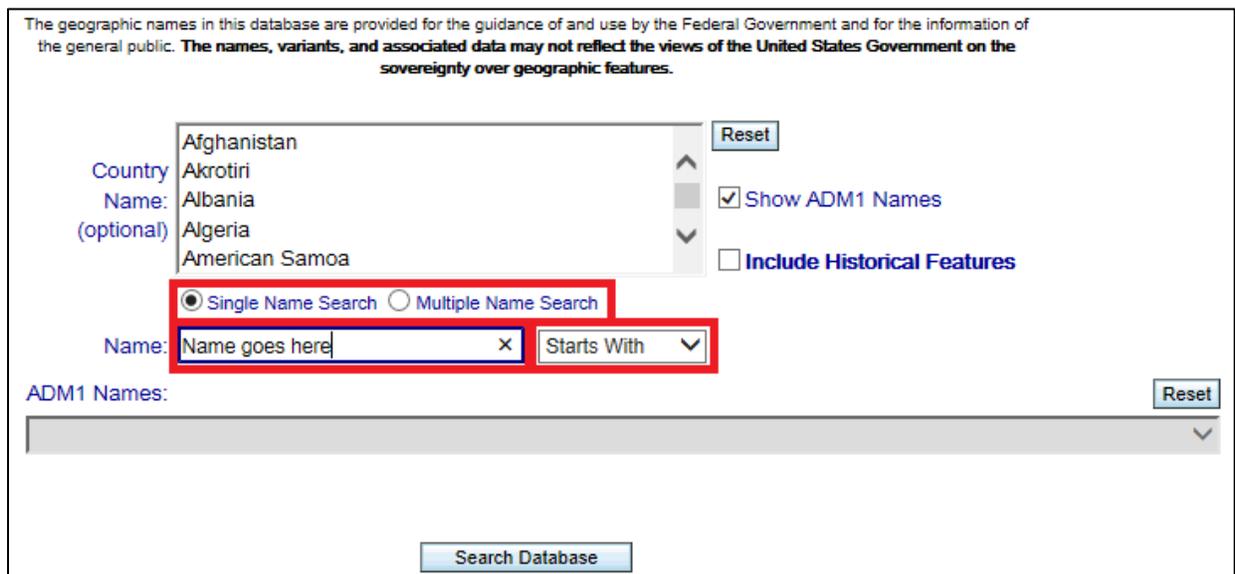

² Reading Order names are useful for, to name a few examples, maps, graphics, papers, publications, databases, and mobile application.

³ Reversed Generic names are useful for, to name a few examples, gazetteers and databases.

Show Me My Query selection box and resulting dialogue box when a query is executed.

There is a master reset button for the entire page which sets all selections back to default values; the **Reset All Options** button located under the **Search** and **Export** buttons. There are section reset buttons, normally located to the right of each section, which can be used to reset each individual section to its default values.

Initial GNS query page where user can select single or multiple names to search for and the type of string matching - defaults to Starts With.

Complexity can be added to a query by including a country⁴ - which activates the first-order administrative division list (ADM1 Names), name type, a particular scale range, feature designation (feature type), and/or a spatial extent using either a bounding box or a radius, to name a few. The more elements selected the more complex the query; the more complex the query, the longer it will take to execute but will produce a narrower set of returned data.

If searching against multiple countries, it might be wise to uncheck the Show **ADM1 Names** box to improve speed of selection.

A Historical Feature⁵ is defined as a "**feature known to no longer exist, or evidence of the feature can no longer be found.**" These features are not included in any GNS search or export results by default. If exposing such features is desired, activate the **Include Historical Features** selection box. When this selection is made, two more fields will be exposed in the search results window; **Effective** and **Termination Dates**. The presence of a date in the Termination Date field indicates a historical feature.

⁴ FIPS PUB 10-4 was withdrawn by the National Institute of Standards and Technology on September 2, 2008 based on Public Law 104-113 (codified OMB Circular A-119 and the National Technology Transfer and Advancement Act of 1995). The National Geospatial-Intelligence Agency (NGA), as the maintenance agency for FIPS PUB 10-4, has continued to maintain and provide regular updates to its content in a document known as Geopolitical Entities and Codes (GEC) (Formerly FIPS PUB 10-4).

The Geopolitical Entities, Names, and Codes (GENC) Standard, the US Government profile of ISO 3166, has subsequently been designated as the replacement standard for FIPS PUB 10-4. The GENC Standard will provide a list of the basic geopolitical entities in the world, together with the principal divisions that comprise each entity. The names of the political entities are derived from official meeting records of the Foreign Names Committee of the US Board on Geographic Names (US BGN). GENC Edition 1 was published on 27 November 2012 and only includes codes at the country level. GENC Edition 2 was published on 31 March 2014. The GENC Standard may be found online at: <https://nsgreg.nga.mil/>. The GENC content may be found in the GENC Registry online at: <https://nsgreg.nga.mil/genc/discovery>.

NGA has discontinued maintenance of Geopolitical Entities and Codes (Formerly FIPS PUB 10-4) as of 31 December 2014. Updates to the GEC content will no longer be posted. The GNS will internally continue to use GEC-like codes for the near future. Once implementation of GENC codes begins, there will likely be a transition period during which both GEC-like (FIPS 10-4) and GENC codes are available to the GNS user.

In this context, the use of **country** is synonymous with **geopolitical entity**.

⁵ In the NGA/BGN Geographic Names Database, a historical feature is a feature known to no longer exist, or evidence of the feature can no longer be found.

A termination date field is employed in the Geographic Names Database to identify historical features. This field is exposed on GNS when the **Include Historical Features** option is selected. The presence of a date in this field indicates a historical feature.

This policy applies only to the NGA/BGN Geographic Names Database of foreign place-name information.

Show ADM1 Names is selected by default where Include Historical Features is not.

Name (Type)	Geopolitical Entity Name (Code)	First-Order Administrative Division Name (Code)	Latitude, Longitude DMS (DD)	MGRS	Feature Designation (Code)	Effective Date	Termination Date	Display Location Using
-------------	---------------------------------	---	------------------------------	------	----------------------------	----------------	------------------	------------------------

Effective Date and Termination Date fields are shown in the query results when Include Historical Features is selected.

Selecting a country activates the first-order administrative division list (ADM1 Names). Select more than one country and/or more than one ADM1 Name using the Ctrl key and the left mouse button.

Custom Search Criteria

Return Selected Name Type(s):

MBR Search Radial Search

Radius:

Select Search Option:

Center Point Unique Feature Id Name

Primary Name:

Secondary Name:

Search for secondary names within the specified radius of the primary name.

Find all instances of this named feature within this radius from this other named feature - all instances of a name that **Starts With** Kandahar (**Secondary Name**) within a 15KM radius from a name that **Starts With** Kabul (**Primary Name**) - returns limited to 15 features, so there is a possibility the query might need to be restricted further, by introducing a country and/or other parameters, to arrive at that magic number.

Results of such a radial search, **Find all instances of this named feature within this radius from this other named feature**, would display the following types of information:

Primary Name	Country	Latitude/Longitude	Feature Type	Matches
--------------	---------	--------------------	--------------	---------

Primary Name: The Primary feature Name used to anchor the search.

Country: The country of the primary feature name - can include multiple countries for shared features.

Latitude/Longitude: Geographic location of feature.

Feature Type: Type of feature located - feature designation code.

Matches: The number of secondary feature names that matched the search criteria - this number is a link that will open another window listing the matched record set when selected.

A zero count (0) under the **Matches** field indicates found matches to the primary feature name string with no matches to the secondary feature name string.

Searching for any feature name that starts with **Umm** (secondary) that falls within a radius of 200KM from a feature name that starts with **Doha** (primary) will yield results similar to the following:

GeoNames Radial Primary Results				
The geographic names in this database are provided for the guidance of and use by the Federal Government and for the information of the general public. The names, variants, and associated data may not reflect the views of the United States Government on the sovereignty over geographic features.				
Primary Name	Country	Latitude/Longitude	Feature Type	Matches
Dohat az Zekrit (Variant)	Qatar	25° 30' 03" N 060° 49' 39" E	bay(s)	435
Dohat al Usainad (Variant)	Qatar	25° 48' 00" N 060° 58' 00" E	bay(s)	431
Dohat as Salwa (Variant)	Bahrain (BA), Qatar (QA), Saudi Arabia (SA)	25° 20' 48" N 060° 38' 40" E	bay(s)	451
Dohat al Hussain (Variant)	Qatar	25° 34' 03" N 060° 53' 28" E	bay(s)	434
Dohat Falshshākh (Variant)	Qatar	25° 36' 30" N 060° 57' 54" E	bay(s)	431
Doha Harbour (Variant)	Qatar	25° 18' 00" N 061° 32' 00" E	harbor(s)	403
Doha (Conventional)	Qatar	25° 17' 12" N 061° 32' 00" E	capital of a political entity	403
Doha (Variant)	Qatar	25° 18' 00" N 061° 30' 00" E	first-order administrative division	403

The entry second from the bottom, **Doha** (Conventional, capital of a political entity), indicates 403 matches to the secondary feature name that starts with **UMM**. Clicking on the number under **Matches** will display a list of the matching record set.
